

TU Graz and the mobility technology company Magna have unveiled one of the most sophisticated driving simulators in the world at the new Advanced Driving Simulation Center on Campus Inffeldgasse. The simulator reproduces an extremely realistic driving experience in a unique way. Research and development teams can use the simulator to realistically test and optimise different vehicles, chassis and tyre set-ups as well as various advanced driver assistance systems (ADAS). Magna covered the acquisition and installation costs, while TU Graz is financing the ongoing running of the Advanced Driving Simulation Center.

“The Advanced Driving Simulation Center is a result of the decades-long innovation partnership between Magna and TU Graz,” says TU Graz Rector Horst Bischof. “With this driving simulator, we now have a research infrastructure that is unique in Europe and will sustainably enhance Austria as an automotive and mobility centre.”

“The Advanced Driving Simulation Center allows us to conduct vehicle studies with results that precisely match the physical conditions of the real world,” says Arno Eichberger, Head of the Institute of Automotive Engineering and responsible for the scientific operation of the testing facility. “With the new simulator, we are closing the gap between theoretical vehicle modelling and the real human perception of our test drivers.”
